

TORQUE MONITORING SYSTEMS

ESI's Model DP-1 Torque Indicator is a construction tool designed to monitor the installation torque of helical (screw type) earth anchors. The DP-1 can be used with all types of equipment and hydraulic motors, including Simon-Telect, Eskridge, and Altec. Quick disconnect "non-spill" couplings provide for permanent installation of the DP-1 to your line truck, or allow for its quick removal and reinstallation as desired.

- **Safety / Protection** - Monitoring installation torque assures that no portion of the tooling, drill stem or anchor exceeds its rated torsional capacity. This protects both personnel and equipment from injury and damage.
- **Quality Control** - The holding capacity of a screw anchor is directly related to its installation torque. Applying this 'torque/capacity' relationship, the DP-1 provides a reliable means of onsite Quality Control for each anchor during installation.
- **Reliability** - The DP-1 is a construction tool designed and built to operate in all types of weather and conditions. Its rugged design minimizes the effects of vibration, mud and dust.

The DP-1 has been granted U.S. and Canadian Patents. Additional U.S. / Canadian Patents are pending. For more information on any of our products contact:
